

# Phalaenopsis

## Light

Bright window with little to no sun. East facing is ideal, shaded south or west facing are acceptable. Never in direct sunlight.

## Temperature

Above 60F at night and between 75-85F during the day is ideal. Night temperatures of 55F are desirable in Autumn to promote flower spikes.

## Water

Thoroughly water and then let nearly dry out. Best if watered only in the morning so that leaves have time to dry out.

## Humidity

Recommended humidity is between 50 and 80%. In the home place the pot on a tray of gravel, but never let the pot sit in water.

## Fertilize

Regularly, especially when weather is warm and plant is growing. Twice a month applications of high-nitrogen fertilizer (ex. 30-10-10) are appropriate. (High-phosphorous 10-30-20 will promote blooming).

## Repotting

Every 1-3 years, after flowering. Remove all old medium from roots, trim roots, add new medium.
